

SOFTWARE ENGINEER + TECHNICAL GENERALIST

SOFTWARE FOR THE REAL WORLD

I build systems that have to survive users, machines, incomplete data, and operational constraints. My strongest lane is the integration layer around learned systems: evaluation, data operations, observability, operator workflows, and reliable full-stack tools.

52M

PARAMETER ACT POLICY

80K+

AUTONOMOUSLY TILLED ACRES

\$1M+

GROSS PLATFORM REVENUE

10M+

DAILY USERS AT TWITCH

SELECTED FIELD
EVIDENCE

Ten years across consumer-scale identity, autonomous machinery, early-stage hardtech, and independently built applied-AI products.

01

LEARNED MACHINES

INDEPENDENT PHYSICAL-AI ENGINEERING • 2026

Trained and evaluated a **52-million-parameter ACT policy** across fixed-seed rollouts, built an inspectable review surface with videos and failure analysis, and brought up a SO-ARM101 leader and follower system through device routing, camera integration, and six-servo validation.

02

AUTONOMY IN THE FIELD

BEAR FLAG ROBOTICS • ACQUIRED BY JOHN DEERE

Co-led the full-stack platform supporting **more than 80,000 autonomously tilled acres** and **more than \$1 million in gross revenue**. Built operator and customer workflows across autonomy, tractor engineering, and field operations.

03

TRUST AT SCALE

TWITCH IDENTITY • OVER TEAMS • BASELINE HEALTH

Built identity systems affecting **more than 10 million daily users**, led web delivery for a design-led enterprise product acquired by GoDaddy, and independently shipped an AI-native health-intelligence system with deterministic audit paths.

RANGE

BUILD

TypeScript, Python, React, Node.js, FastAPI, SQL

OPERATE

AWS, Docker, APIs, data pipelines, CI/CD, observability

INTEGRATE

LLMs, model evaluation, UX research, product strategy, operator workflows
